

Business Transactions Made Simple & Secure

Manage Your Risk & Speed Up Your Deals

Consumer file-sharing services like Dropbox and Google Drive are great for online storage, but they're not ideal for collaborating on business transactions with sensitive information. InceLink's secure enterprise platform helps firms mitigate their risk, enhance their productivity, and gain critical insights into project activity.

Controlled Access

InceLink has customizable permissions that let you control who can access what inside a private workspace. (Share links are not secure; if you share a file/folder and the link is forwarded to others, third parties can access the information.)

Document Security

We offer optional settings to control how invitees can access information, including view only, watermarking, and downloading options. Files uploaded to simple file storage solutions like Google Drive and Dropbox can be downloaded and shared without your awareness or approval.

Reporting

InceLink lets you track the digital footprints of everyone who accesses your workspaces and downloads data. This provides both compliance/audit trail information as well as operational insight into which parties are doing serious due diligence.

Communication

InceLink enables both sides to communicate directly through its platform, cutting down on email and lost messages. Administrators can send updates to any user group they choose to alert them to new files, deal changes, pending deadlines, etc.

Q&A

Potential investors/buyers can ask questions directly through the site while reviewing documents. Questions are queued up for administrators, who can then coordinate responses.

The Bottom Line

InceLink gives you control, keeps your information safe, helps you manage who can access what, and gives you analytical insight into what your prospects are doing. If you're serious about managing deals, DropBox, Google Docs and the likes aren't serious alternatives.
